ABSTRACTED-PUB-NO: JP63084089A

BASIC-ABSTRACT: Flexible printed circuit substrate is
produced by (1) preparing
polyamic acid from (A) 90-100 molar pts. of acid component
consisting of (a)
50-80 mole% of 3,3',4,4'-biphenyl tetracarboxylic acid
dianhydride and (b)
50-20mole% of pyromellitic acid dianhydride and (B) 100
molar pts. of diamine
component consisting of (c) 50-80 mole% of paraphenylene
diamine and (d) 50-20

mole% of 4,4'-diaminodiphenyl ether at first by a reaction of the cpd. (a) and cpd. (c), and then by addn. of cpd. (b) and cpd. (d) into the reaction prod. to obtain polyamic acid; (2) applying polyamic acid onto surface of a metal foil; (3) heating from 100 deg.C to 300 deg.C in at least 0.5 hr.; (4) winding the ~~foil~~ around a cylinder of dia. 50-100mm so that the metal layer of the foil contacts with the cylinder; and then (5) heating from 300-350 deg.C in at least 0.5 hr..

USE/ADVANTAGE - The flexible printed circuit substrate has, excellent heat resistance, cold resistance, mechanical property, electric property, wear resistance, chemical resistance and curling resistance.

ABSTRACTED-PUB-NO: JP01173687A

BASIC-ABSTRACT: The tetracarboxylic acid dianhydride component of the substrate consists of 3,3',4,4'-biphenyl tetracarboxylic acid dianhydride, 50-80 mols.%, and pyromellitic acid dianhydride, 50-20 mols.%. The diamine component consists of paraphenylene diamine, 50-80 mols.% and 4,4'-diaminophenyl ether, 50-20 mols.%. The tetracarboxylic acid dianhydride component is reacted with the diamine component to obtain a polyamic acid soln, which is applied to one face of a copper foil and heated to obtain a laminated polyamide face. An adhesive compsn. formed by adding a multifunctional aziridine cpd. to a resin

compsn. is applied to the polyamide face. The resin
compsn. consists of a
terminal carboxylic acid polyester resin comps., 30-95
wt.% and polyether
imide, 70-5 wt.% of the formula (I). The terminal
carboxylic acid polyester
resin comps. is obtd. by reacting an acid and an alcohol
component. The acid
component consists of terephthalic acid, 40-95 mols.%,
isophthalic acid and/or
4-10C aliphatic dicarboxylic acid, 60-5 mols.%. The
alcohol component consists
of ethylene glycol, 30-95 mols.%, tetramethylene glycol
and/or polytetramethy
lene glycol, 70-5 mols.%. The applied faces or the applied
faces and the
laminated polyimide face are pasted.

USE/ADVANTAGE - The substrate exists no adhesive layer
between the copper foil
circuit layer and the polyimide layer. No adhesive layer
provides the
substrate with heat resistance, freezing resistance,
humidity resistance
insulation, and high freq. characteristics.
